- ▶ **WHAT could be used otherwise?**
- ▶ **WHO benefits from visualization?**
- ▶ **METHODOLOGY challenges and solutions**
- ▶ **WHAT could be developed next?**

"Logic is everywhere ..."

Motivation

- ▶ **DP-on-TD-algorithms can solve Model Counting and various combinatorial problems**
- ▶ **Implementations of those are competing with modern solvers**
- ▶ **But:** those are fairly hard to implement efficiently
- ▶ **Practical debug output quickly becomes very large (GB)**
- ▶ **Finding the cause of the problem is a time consuming challenge**

The B.T. probably focused too much on the convenience features, and not on the urgent need for better debugging and visualization needs for those algorithms.

Background

The algorithms of interest solve problems of:

- ▶ **combinatorics (NP-problems)**
- ▶ **model-counting (#P-problems)**

Recent promising results for Projected Model Counting by Markus Hecher¹.

(eds) Theory and Applications of Satisfiability Testing - SAT 2020. SAT 2020. Lecture Notes in Computer Science, vol 12178. Springer, Cham. https://doi.org/10.1007/978-3-030-51825-7_25

Tree Decompositions

A tree decomposition is a tree obtained from an arbitrary graph s.t.

1. **Each vertex must occur in some bag**
2. **For each edge, there is a bag containing both endpoints**
3. **Connected: Subgraph “restricted” to any vertex must be connected**

gpusat2 - Solving on GPU

- Customized tree decompositions
- Adapted memory-management
- Improved precision handling

Database templates in Python Generating SQL queries

1. Create graph representation
2. Decompose graph
3. Solve sub-problems
4. Combine rows

```

- #εTab#:          SELECT 1 AS cnt
- #intrTab#:        SELECT 1 AS val UNION ALL 0
- #localProbFilter#: (l1,1 OR ... OR l1,k1) AND ... AND (ln,1 OR ... OR ln,kn)
- #aggrExp#:        SUM(cnt) AS cnt
- #extProj#:        τ1.cnt * ... * τℓ.cnt AS cnt

```

(a) Problem #SAT

```

- #εTab#:          SELECT 0 AS card
- #intrTab#:        SELECT 1 AS val UNION ALL 0
- #localProbFilter#: ([u1] OR [v1]) AND ... AND ([un] OR [vn])
- #aggrExp#:        MIN(card) AS card
- #extProj#:        τ1.card + ... + τℓ.card - (Σi=1ℓ |χ(ti) ∩ {a1}| - 1) *
                    τ1. [a1] - ... - (Σi=1ℓ |χ(ti) ∩ {ak}| - 1) * τ1. [ak]

```

(b) Problem MinVC

- ▶ SAT and #SAT
- ▶ #o-Coloring
- ▶ Vertex cover

...

3. Cross reference with standalone tree-decomposition

4. Fix the root cause

Related Work

Related Work Schluss / Wiss Arbeiten

Outlook

Static → Dynamic

- ▶ Enrich the visualization with debugging info for each node
- ▶ Cross reference the creation of rows in parent nodes
- ▶ For more advanced debugging tasks you may also need to revise the approach

- ▶ Bottlenecks of different architectures
- ▶ Preselection of interesting areas/data to visualize
- ▶ Utilizing graph databases for visualization and queries for debugging

Summary

This thesis created tdvisu as a tool that

- ▶ **integrates into existing implementations**
- ▶ **statically exports data from runs**
- ▶ **compiles simple SVG graphics**

it integrates well into both used systems and provides a starting point for future investigations into implementations of dynamic programming on tree decompositions and bug spotting and fixing by using visualizations.
