

Visualizing Dynamic Programming On Tree Decompositions

Martin Röbke Fakultät Informatik Technische Universität Dresden Germany

- WHAT is the motivation
- WHO benefits from visualization?
- CHALLENGES and solutions
- ▶ WHAT could be used otherwise?
- OUTLOOK and ideas

Motivation

- DP-on-TD-algorithms can solve Model Counting and various combinatorial problems
- Implementations of those are competing with modern solvers
- ▶ But: those are fairly hard to implement efficiently
- Practical debug output quickly becomes very large (GB)
- ▶ Finding the cause of the problem is a time consuming challenge

The B.T. probably focused too much on the convenience features, and not on the urgent need for better debugging and visualization needs for those algorithms.

Background

The algorithms of interest solve problems of:

- combinatorics (NP-problems)
- model-counting (#P-problems)

Recent promising results for Projected Model Counting by Markus Hecher¹.

(eds) Theory and Applications of Satisfiability Testing - SAT 2020. SAT 2020. SAT 2020. In: Computer Science, vol 12178. Springer, Cham. https://doi.org/10.1007/978-3-030-51825-7.25

Tree Decompositions

A tree decomposition is a tree obtained from an arbitrary graph s.t.

- 1. Each vertex must occur in some bag
- 2. For each edge, there is a bag containing both endpoints
- 3. <u>Connected</u>: Subgraph "restricted" to any vertex must be connected Graphic

Graphs for Boolean Formulas

► Example set of CNF-clauses:

$$\{c1 = \{v1, v3, \neg v4\}, c2 = \{\neg v1, v6\}, c3 = \{\neg v2, \neg v3, \neg v4\}, c4 = \{\neg v2, v6\}, c5 = \{\neg v3, \neg v4\}, c6 = \{\neg v3, v5\}, c7 = \{\neg v5, \neg v6\}, c8 = \{v5, v7\}\}$$

Figure: The primal (left), incidence (middle) and dual (right) graph

gpusat2 - Solving on GPU

- Customized tree decompositions
- Adapted memory-management
- Improved precision handling

Visualization in Action

MinVC example size 90 (expected 82)

Visualization in Action

- 1. Inspect visualization
- 2. Verify findings in solver (in this case dpdb)

3. Cross reference with standalone tree-decomposition

4. Fix the root cause

Outlook

Static → Dynamic

- ► Enrich the visualization with debugging info for each node
- Cross reference the creation of rows in parent nodes
- For more advanced debugging tasks you may also need to revise the approach

Interesting Questions

- Bottlenecks of different architectures
- Preselection of interesting areas/data to visualize
- Utilizing graph databases for visualization and queries for debugging

Summary

This thesis created tovisu as a tool that

- integrates into existing implementations
- statically exports data from runs
- compiles simple SVG graphics

For further research it provides

- starting point for more complex investigations of
 - bug spotting
 - and fixing by using visualizations
